Introduction & Examples

The aim of the brochure on hand is to offer documentation describing the exchange of receiving data between business partners.

The basis of this elaboration is the international standard EANCOM® 2002. The message type RECADV 009 is used to transmit relevant data. GEFEG.FX (Gefeg mbH, Berlin) was used as the documentation tool.

Please be aware to know that this booklet does not replace the complete specifications in the original chapters or other relevant instructions within the EANCOM® 2002 documentation. Instead, it deals with the description of segments, data elements and codes to be used for a specific task.

The current documentation has been produced by the GS1 Germany GmbH in Cologne. GS1 Germany assumes no liability for any damages incurring from the use of this documentation. This brochure or extracts thereof may only be published or forwarded to third parties with the express written consent of GS1 Germany, which holds copyright on this work.

GS1 Germany thanks all experts who contributed significantly to these guidelines with knowledge from their daily business.

Important note

To fulfill the requirements of directive 2003/58/EG, article 4, C058 has been opened in NAD segments identifying a message sender. If the place in the 5 DE 3124 is not sufficient, the following RFF segments can be used, qualified with DE 1153 = GN. DE 1154 has got a capacity of 70 digits. Only in those cases, when no RFF segment follows NAD, a RFF+GN can be used in the heading section of the message. Within the EDI recommendations of GS1 Germany this is only applicable for the messages REMADV and SLSFCT.

This brochure offers different ways to start

Introduction

"Introduction" contains a short description of the respective message.

BusinessTerms

"Business Terms", is a table which links directly to the sequence numbers of the segments.

Diagram

"Diagram", is a hierarchical graphic depiction of all used segments in the same sequence as they are defined in the EANCOM® message. However, every segment is shown only once, and it is therefore possible that the sequence numbering is interrupted.

Structure

"Structure", is a list of all used segments in the same sequence as they are defined in the EANCOM® message. In general, for each piece of information one single segment is provided. Exeptions may arise when the the occurrence of a segment is limited and can contain alternative information (e.g., segment BGM).

Segmentlayout

"Segmentlayout", an illustration that has been chosen to match the business terms (data from the inhouse application) with the elements from the EANCOM® syntax.

Einführung

Codes

"Codes" contains a list of the codes used in the message.

Examples

"Examples", provides at least one message example with comments. Please note that, for technical reasons, the examples can contain component data element separators, which would otherwise be represented as data element separators in the original messages.

Print

"Print" opens the PDF documentation for the corresponding message.

Message structure

Heading section

Specification of message sender and receiver, delivery party, receiving date and document number.

Detail section

The detail section mirrors the detail section of the DESADV message and is used to specify differences between quantities advised and received, if applicable.

Summary section

The summary section contains no data and has syntactical reasons.

Project description

The receiving advice message is sent from the retailer to the supplier after the physical receiving of goods. It specifies details of goods received on agreed conditions.

The message relates to a single despatch point and a single receiving point. It may cover a number of different items or packages. It gives information to the consignor about received and accepted/not accepted goods.

New with recommendation 2008:

The transmission of a DESADV by the sender of goods is a pre-condition for that process. The following RECADV indicates again all information of the heading and detail section inclusive SSCC. It is also recommended to send back the batch number. This is to be agreed bilaterally by the partners. Like SSCC the indication is not mandatory, but helps in the process of tracking and tracing. Both, correct deliveries and discrepancies are communicated. The data from the RECADV can directly be used to create an INVOIC without differences.

This procedure is recommended to minimise differences in invoices at later time.

<p>This segment is used to envelope the interchange, as well as to identify both, the party to whom the interchange is sent and the party who has sent the interchange.</p> <p>For international EDI the use of character set UNOA is recommended. For national (German) EDI the use of UNOC is reasonable because it contains lower case letters and umlauts.</p> <p>Note DE 0008: The address for reverse routing is provided by the interchange sender to inform the interchange recipient of the address within the sender's (source) system to which responding interchanges must be sent. It is recommended that the GLN be used for this purpose.</p> <p>Note DE 0014: The routing address is used to identify the receiver, if a provider adds service values for the actual receiver (e.g. consolidated companies, corporate group). The use of the identification system (e.g. GLN) has to be agreed bilaterally.</p> <p>Note DE 0020: This data element must contain a consistent sequential number per interchange between sender and receiver of the transmission.</p> <p>Note DE 0032: This data element is used to identify any underlying agreements which control the exchange of data. Within EANCOM , the identity of such agreements must start with the letters 'EANCOM', the remaining characters within the data element being filled according to bilateral agreements.</p> <p>Example: UNB+UNOC:3+4012345000009:14:4012345000018+4000004000002:14:4000004000099+201212:1043+4711+REF:AA+++EANCOM+1' The EANCOM file 4711 dated 12.12.2020, 10 h 43 is sent by the issuer identified with GLN 4012345000009 to the receiver identified with GLN 4000004000002.</p>

Segmentstatus: Mandatory, if variances apply

This segments indicates the variances between accepted (QTY+194) and depatched/advised (QTY+12) quantity.

Calculation formula: Variance (QVR) =Accepted (QTY+194) - Despatched/Avised (QTY+12)

For negative values (e.g. not accepted damaged goods) the minus sign must be used for variances. It is not possible to indicate a measurement unit. It is identical with the measurement of the accepted quantity (QTY+194).

Note DE 4221: Only the listed qualifiers may be used.

Example: QVR+-4:195+AF+AT'

4 damaged units have not been accepted.
